

Inshore Marine Protected Area and Priority Marine Features Consultation

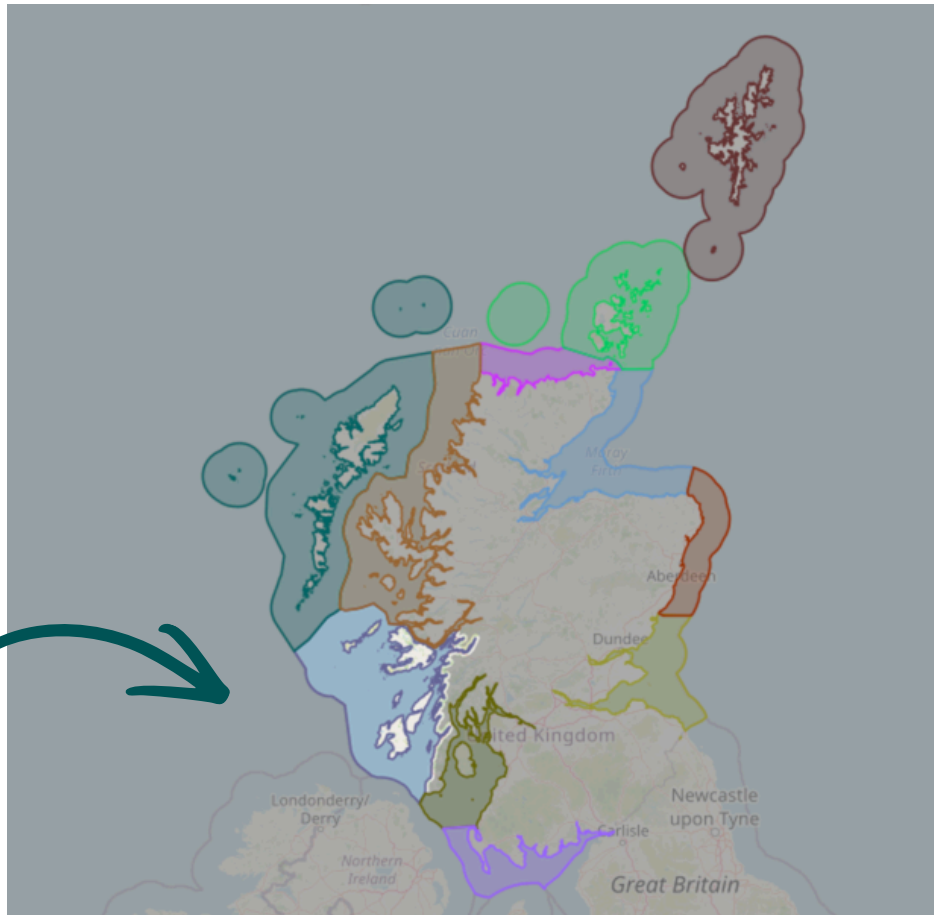

Argyll

11/11/2026

Introduction

Here you will find a briefing manual for the Proposed Fisheries Management Measures for Inshore Marine Protected Areas (MPAs) and Proposed Priority Marine Feature (PMF) Management Areas within the Argyll Region.

Argyll Scottish Marine Region is a biologically diverse coastal area on the southwest coast of Scotland characterized by over 3,000 km of indented coastline, rugged sea lochs, and 23 inhabited islands.

Argyll Marine Region

The Our Seas Coalition

The Our Seas coalition represents over 170 organisations, each with its own voice for the sea. We are united by a shared vision of greater protection for Scotland's inshore environment, however, individual members bring their own regional knowledge, priorities and perspectives on what that protection should look like. Consequently, our members will have their own individual views on the options presented within the consultation.

Our Seas encourage you to reach out to members in your area to learn more about their individual position.

Click here to be taken to the Members Directory!

The Consultation

After almost a decade of delay, the Scottish Government has finally launched its consultation on the future protection of inshore marine habitats and species. You can view it here.

This is the chance for real protection to be implemented in Scotland's inshore waters after over 10 years of simply designation.

Within this consultation, the Scottish Government is asking for the public's opinion on proposed fisheries management measures for both sites and areas, where sites include: NCMPAs, SACs and SPAs and areas include locations where the 11 Priority Marine Features features have been identified outside MPAs.

In Argyll, the consultation includes proposed fisheries management measures for:

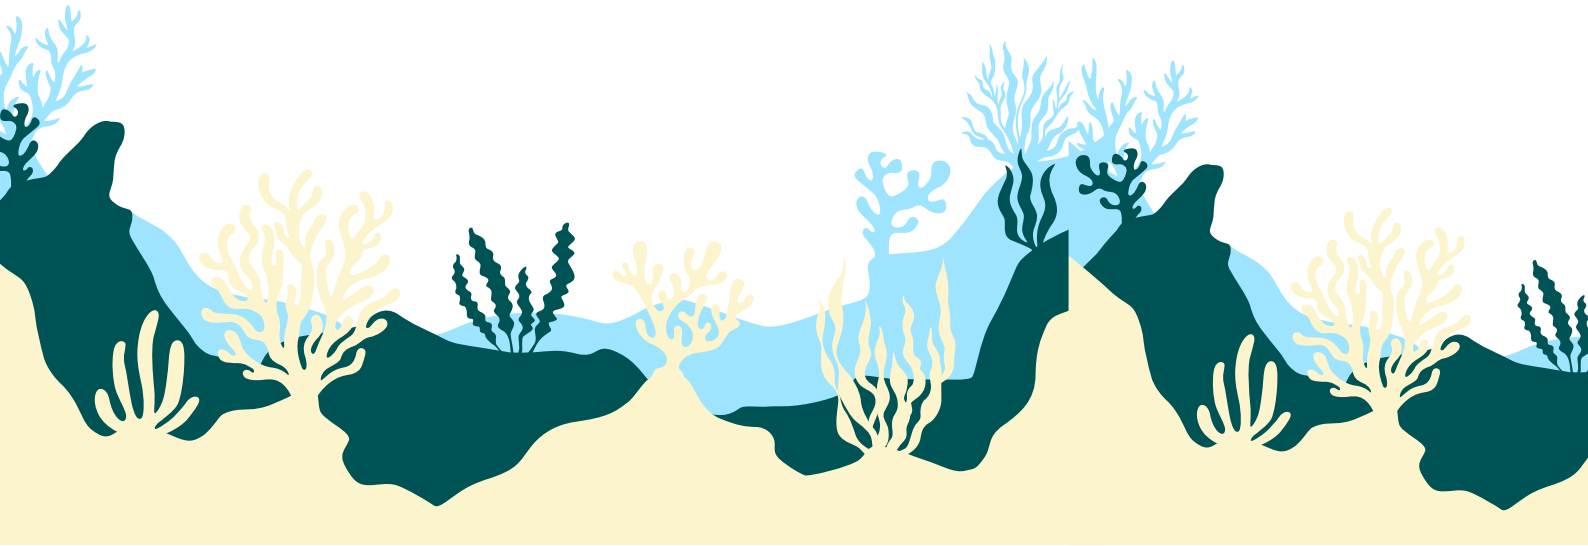

1 NCMPAs

3 SACs

3 SPAs

13 PMF areas

This briefing will outline the sites that are designated to protect a seabed feature that is directly threatened by bottom-towed gear, in line with the asks of Our Seas. For more information on other sites in your area, follow this link!

MPA Sites Proposed Options

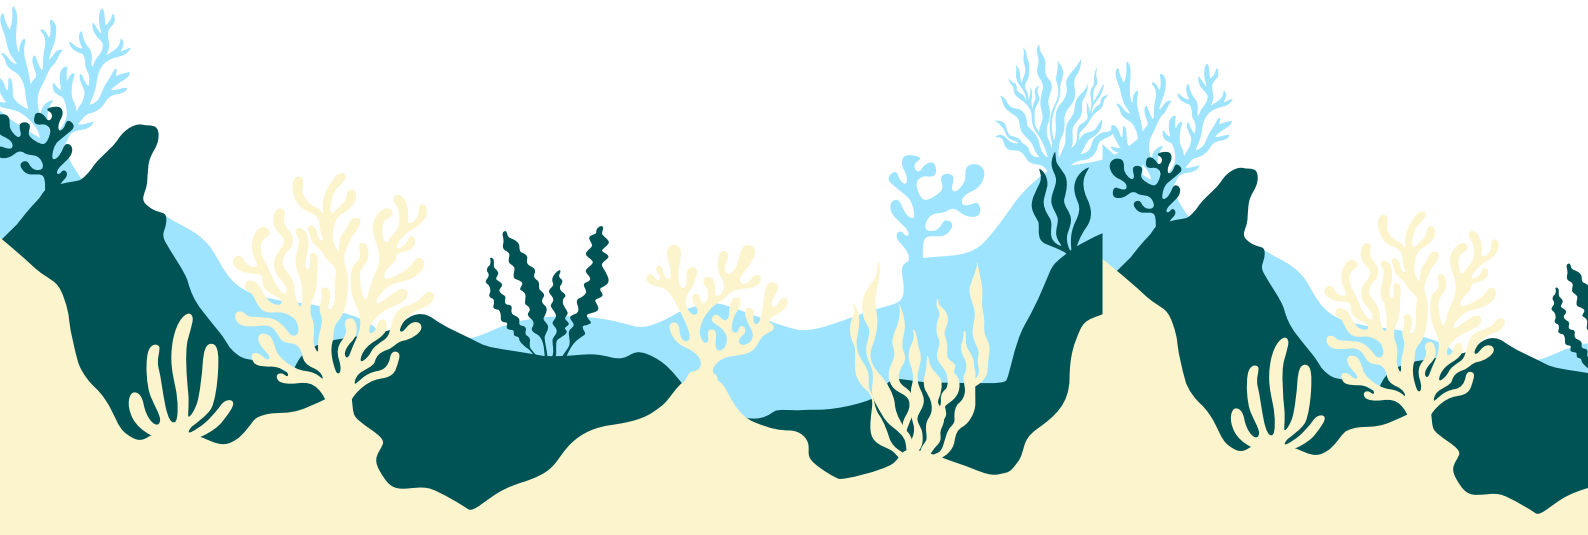

For the majority of the **MPA sites**, 2 options will be proposed. In some cases, only 1 option is proposed due to the conservation objectives of that site.

Option 1 - Zonal measures: Rules for specific fishing gears that may apply seasonally or to vessels above a certain engine power.

Option 2 - Full site measures: Rules on specific fishing gears that apply across the whole site all year round.

Other: If you disagree with both options, you can select 'Other' and explain your reasons in the comments box.

Relevant Questions in this Region: Sites: Q44 - 45

Our Seas Coalition's Position

MPAs

Protect all seabed MPAs from bottom trawling and dredging to support healthy marine ecosystems, coastal communities and sustainable livelihoods.

If you agree, Our Seas suggest you could submit a response, as follows;

- Support **Option 2** for all the MPA seabed sites that propose a **full site closure to all bottom towed fishing gear**. This would mean that more damaging fishing practices such as bottom trawling and scallop dredging will not be allowed in sites designated to protect the seabed, allowing seabed habitats to recover.

- There are 3 sites that have a seabed feature designated which do not propose full site closure to all bottom towed gear, and Our Seas will be calling for stronger protections for these sites in the form of full site closure to all bottom towed gear. These are, Clyde Sea Sill NCMPA, Moine Mor SAC and North East Lewis NCMPA.

Why?

Because the sedbed should be protected. Bottom trawling and dredging physically disturb the seabed, damaging species and reducing the abundance and diversity of marine life. Closing seabed MPAs to bottom-towed fishing allows seabed habitats to recover and provides the **strongest protection** for the features the MPAs were designated to conserve.

What protection can look like...

On the Isle of Arran, Scotland's only No Take Zone and wider South Arran MPA show how effective marine protection can be, with bottom trawling and dredging restrictions helping to protect and restore the seabed.

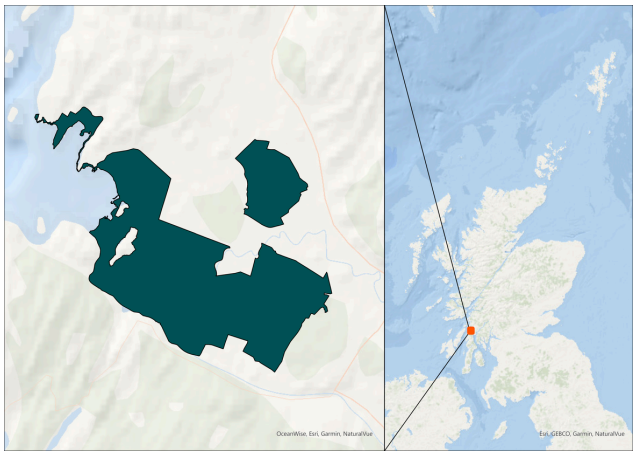

Research has found increases in king scallop and lobster numbers, greater marine biodiversity and healthier habitats, while supporting local communities through activities such as diving, snorkelling and commercial scallop diving. Go to COAST's website to read more.

📷*Howard Wood - COAST: A before and after of the seabed once protection came into place*

Moine Mhor SAC

ARGYLL

The Mòine Mhór SAC encompasses an extensive raised bog complex and associated habitats in Mid-Argyll. To the west, the site extends into the Loch Crinan estuary, incorporating intertidal mudflats, sandflats, and saltmarsh communities. flats, salt meadows, and raised bog on the west coast of Argyll.

Protected Features

Intertidal mudflats and sandflats
Coastal wetlands that are submerged at high tide and exposed at low tide.

THREATS
Sensitive to physical change with typically low resilience and slow recovery

Our Seas recommends:

NEITHER OPTION

For this site

This site only has one proposed option yet it does not fully close the site to bottom towed fishing gear. Therefore we support rejecting the option and propose a full site closure to bottom towed gear in order to protect intertidal mudflats and sandflats which provide habitat for many seabed speices and provide protection from coastal erosion.

Have your say!

Respond by email by filling in the form on our website, answering Q.44 - Q.45 and emailing it to **marine_biodiversity@gov.scot**

PMF Areas Proposed Options

For the majority of **PMF areas**, 2 options will be proposed, in some cases, only 1 option is proposed.

Both options restrict bottom-towed fishing gear. The consultation is about the size of the area where these restrictions will apply.

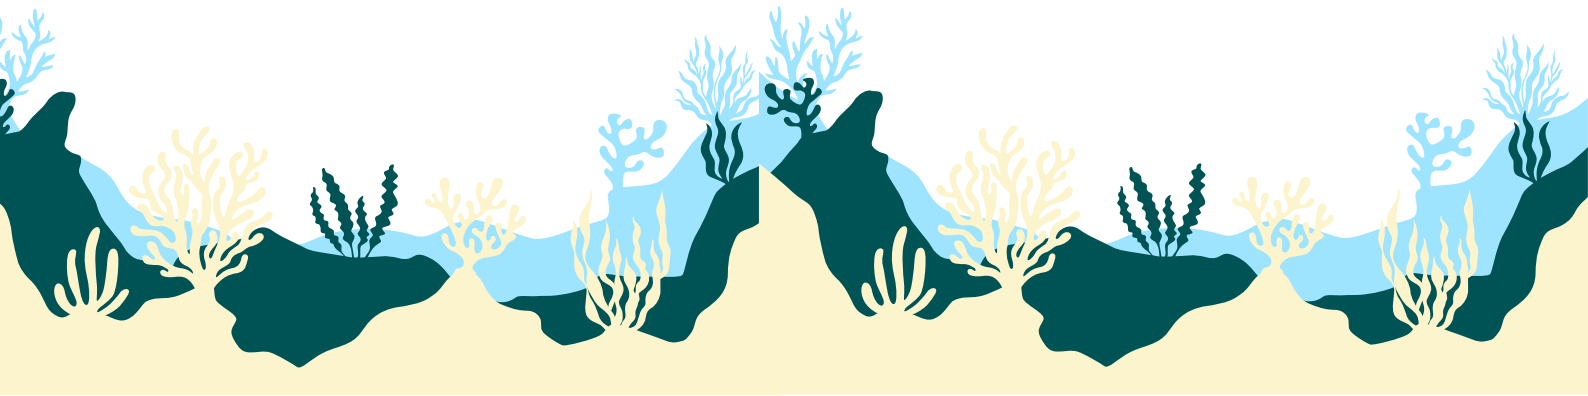

Option 1 - Smaller protected area

Option 2 – Larger protected area: Includes a buffer around the PMF, although the difference from Option 1 is small.

Other: If you disagree with both options, you can select ‘Other’ and explain your reasons in the comments box.

Both proposed options for are not adequate because:

- The areas are **not large enough** to provide real protection that is truly enforceable.
- Many populations of the 11 PMFs are **found outwith the proposed areas and therefore have no protection.**

Our Seas Coalition's Position PMFs

Neither of the proposed PMF options will provide sufficient protections; they do not go far enough to help restore the seabed, allow marine ecosystems to recover or to support sustainable fisheries. We believe at least 30% of Scotland's inshore should be protected from more damaging fishing activities like bottom trawling and dredging.

If you agree, we suggest you submit a response as follows:

- Support **Option 2 at a minimum**. We then encourage you to also ask for at least **30% of Scotland's inshore waters to be protected** from the more damaging fishing activities like bottom trawling and dredging, in line with the coalition's ask of a **modern inshore limit adapted to the needs of each Scottish Marine Region.**

- If you want to go into more detail, Our Seas suggests this could look like:
    - In the West Highlands Marine Region no dredging or trawling within 3 nautical miles of shore.
    - In the Outer Hebrides Marine Region no dredging or trawling within 1 nautical mile of shore.
    - As Shetland has it's own Regulatory Order, leave it to to resolve it's own protection.
    - Throughout the rest of the Scottish Marine Regions, no dredging or trawling within 1 nautical mile or waters shallower than 45/50m.

PMF Areas

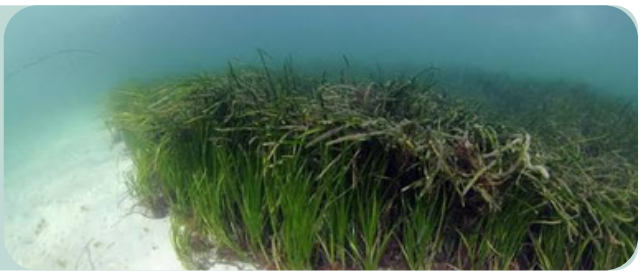

In this section, we will summarise the PMF management areas proposed for Argyll. These are locations where populations of the 11 most vulnerable PMFs have been found outside the MPA network and where the Scottish Government are proposing protection from trawling and dredging. **Read the profile for each of these 11 PMFs here!**

If you agree that the proposals are not sufficient, answer Qs 65 - 105 as we have set out above.

Loch a' Chnuic and Ardilistry (Islay)

Designated to protect:

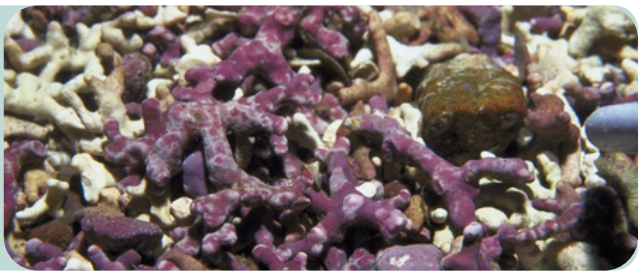

Seagrass beds

Loch a' Chumhainn (Mull)

Designated to protect:

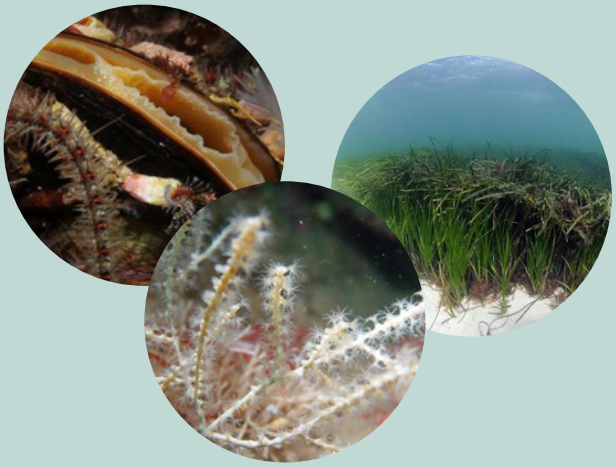

Maerl beds

Loch Craignish (Argyll)

Designated to protect:

Horse mussel beds,
Northern sea fan and sponge communities,
Seagrass beds

Loch Indaal (Islay)

Designated to protect:

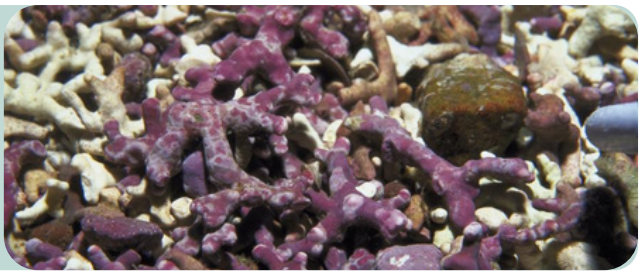

Horse mussel beds,
Seagrass beds,
Also blue mussels beds present but not desginated.

Loch Tarbert (Jura)

Designated to protect:

Maerl beds

Gigha, North-East

Designated to protect:

Horse mussel beds

Port Appin to Lismore (Loch Linnhe)

Designated to protect:

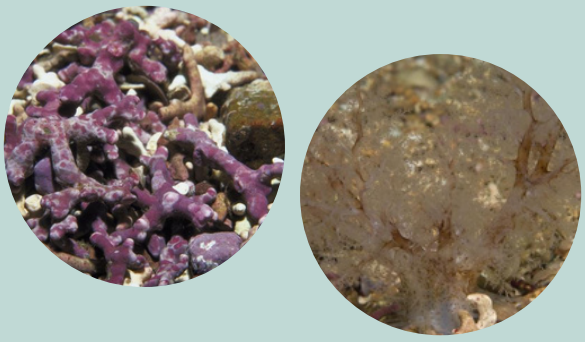

Flame shell beds
Horse mussel beds

Port Ellen (Islay)

Designated to protect:

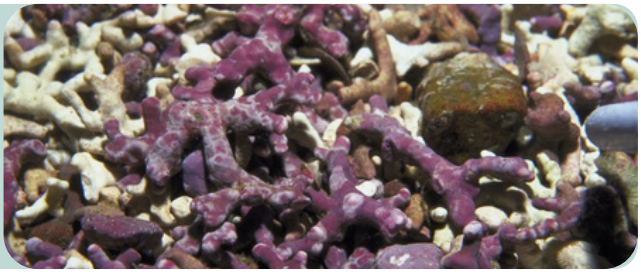

Maerl beds,
Maerl or coarse shell gravel with burrowing sea cucumbers.

Gigha, South

Designated to protect:

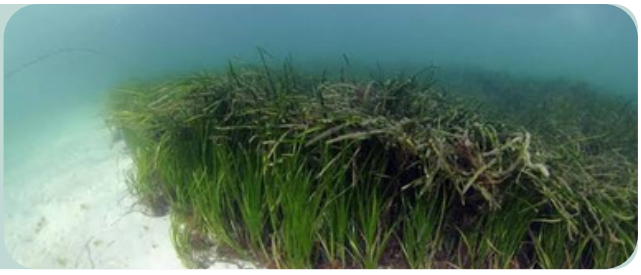

Maerl beds

Sound of Iona (Mull)

Designated to protect:

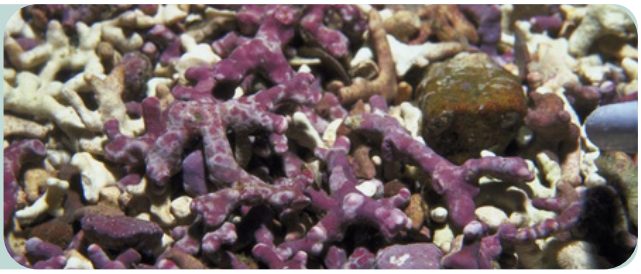

Seagrass beds

Sound of Islay (Islay)

Designated to protect:

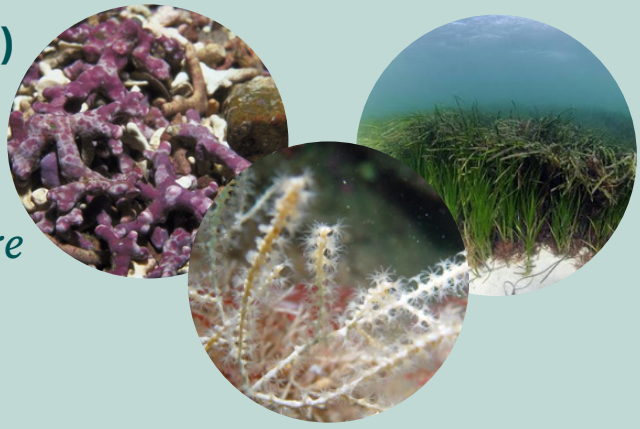

Maerl beds

Ulva and Loch na Keal (Mull)

Designated to protect:

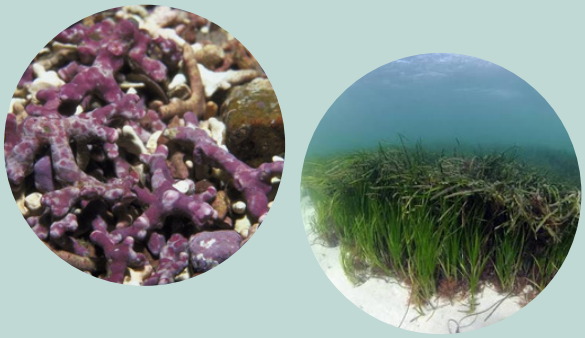

Maerl beds,
Northern sea fan and sponge communities,
Seagrass beds

West Loch Tarbert (Kintyre)

Designated to protect:

Maerl beds,
Seagrass beds
